CUSTOMER SUCCESS / INTERNAL BUSINESS REVIEW

Landscape SaaS Operational Readiness Review

Onboarding · Remote Administration · Customer Risk · Resolution SOP

1
managed Ubuntu instance

4 / 6
successful recorded activities

3
reusable support playbooks

Operational assessment based on one controlled Ubuntu 24.04.4 LTS test instance

Felix Tong
Graduate Customer Success Manager
tongyifei_009@outlook.com

Operational snapshot

managed instance

1

Ubuntu 24.04.4 LTS

activities logged

6

4 succeeded · 2 failed

first value milestone

Achieved

Remote script returned expected output

support scenarios

3

Script · tasks · process visibility

Recorded activity outcome

4 Succeeded **2 Failed (script setup)**

Both failures were resolved before the final script success.

Work completed

- ✓ Instance registration and online verification
- ✓ Ubuntu Pro service-status cross-check
- ✓ Remote script troubleshooting and validation
- ✓ Package install / uninstall and reboot

Validation scope & evidence

Environment

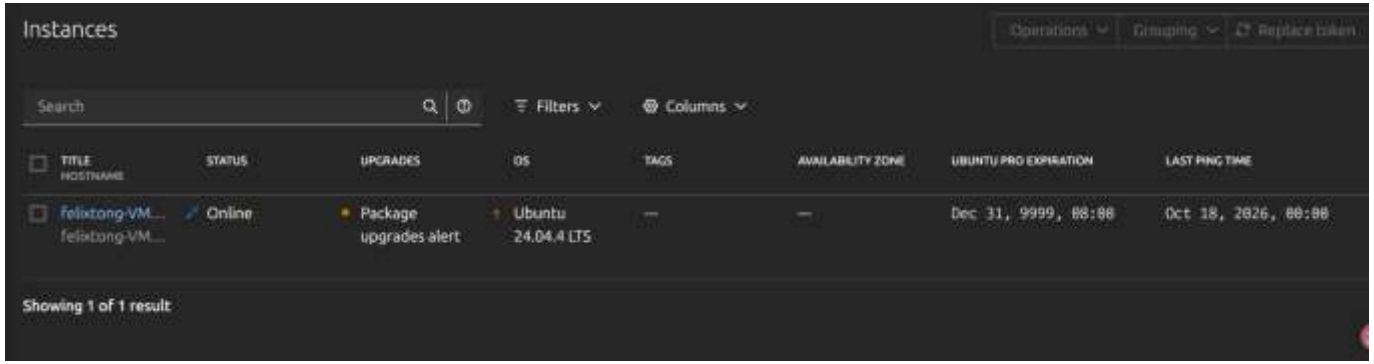

VMware · Ubuntu 24.04.4 LTS
landscape-client 24.02-0ubuntu5.7

Validated actions

Register · Run script · Install/Remove
Restart · Ubuntu Pro status

Evidence sources

Landscape UI · Activities output
Terminal cross-check · client logs

Scope boundary

— Single instance only

— No production SLA assessment

— No enterprise-scale validation

— No real customer interviews

From onboarding to first value

01
Environment
Ubuntu + VMware

02
Pro enabled
ESM / Landscape

03
Device online
Registered

04
First run
Script failed

05
Remediated
Plugin + identity

06
Value proven
Script succeeded

TTFV achieved after the first successful, verifiable remote script execution.

Key friction points: account configuration, script execution prerequisites, and user permission restrictions.

Script execution: issue to resolution

17:46

Plugin unavailable

FAILED

ScriptExecution not enabled

18:06

Root user rejected

FAILED

Execution identity restricted

18:13 → 18:16

Authorized execution

SUCCEEDED

Hostname, uptime and dpkg returned

Validated remediation

1. Inspect manager.log
2. Enable ScriptExecution
3. Set script_users
4. Rerun as authorized user

Outcome: remote execution restored without bypassing root-user restrictions.

Remote administration validation

INSTALL

cbonsai 1.3.1-1

21:47 → 21:50

Local dpkg-query confirmed installed

REMOVE

cbonsai

21:56 → 21:59

Local query confirmed not installed

REBOOT

Ubuntu instance

22:09 → 22:12

Instance later returned Online

Auditability

Activities records creation, delivery, completion, outcome and command output.
However, submit-time confirmation was not clearly perceived during Install / Remove.

Customer experience risk register

ID	Observation	Assessment	Priority
UX-01	**Install / Remove submission feedback not apparent**	Observed twice	HIGH
UX-02	**Script execution prerequisites unclear on first use**	Resolved setup friction	HIGH
UX-03	**Online instance shows “No processes running”**	Root cause unverified	INVESTIGATE
UX-04	**dpkg marked “Security upgrade”; candidate matches installed**	Semantics / sync unclear	INVESTIGATE

No product defect is asserted where data synchronization or status semantics remain unverified.

Customer-facing response playbooks

01

Task submitted, no visible response

RESPONSE

Locate activity → explain states → verify locally

SUCCESS CRITERION

Help admin independently track asynchronous work.

02

Remote script execution fails

RESPONSE

Check Online → plugin → script user → read-only retest

SUCCESS CRITERION

Restore authorized execution or escalate to Support.

03

Processes page shows no data

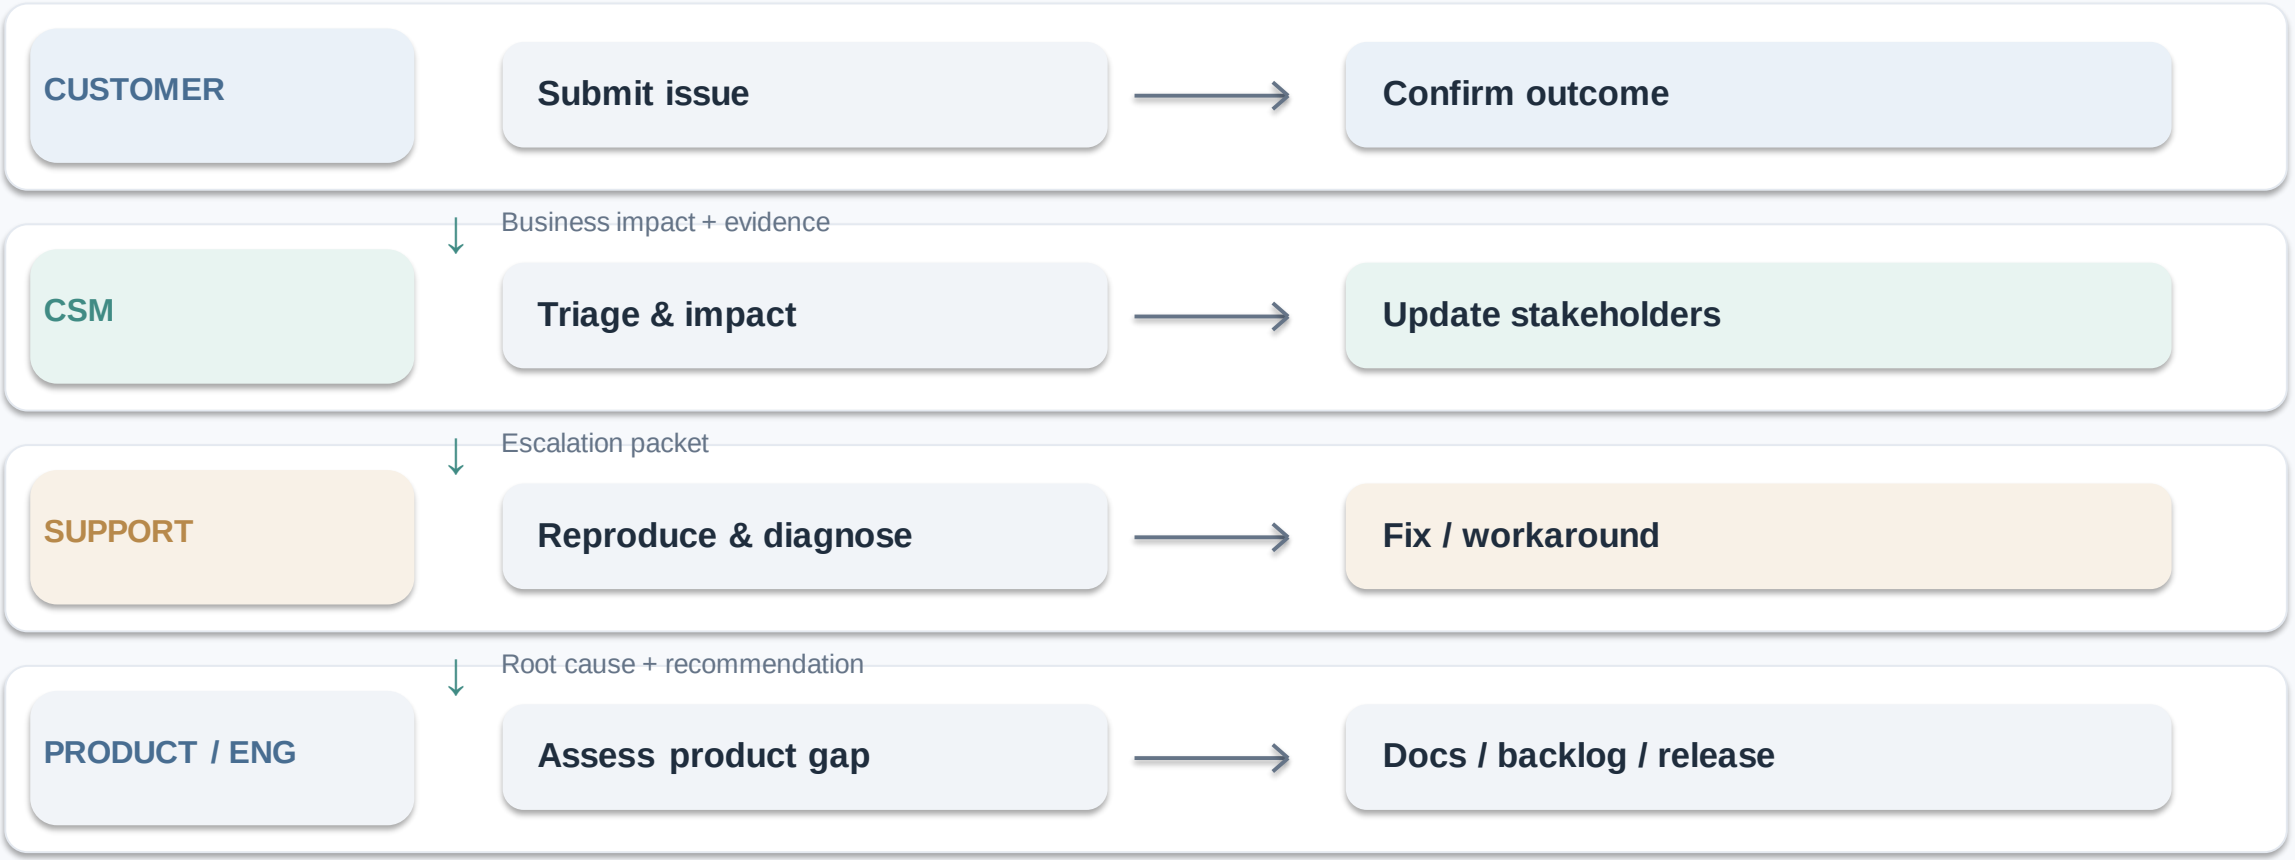

RESPONSE

Clarify goal → collect logs → avoid assumptions

SUCCESS CRITERION

Offer interim query path and investigate data flow.

Cross-functional incident SOP

CSM owns customer communication and closure; Support owns diagnosis; Product/Engineering owns product change.

Next-phase action plan

01 Onboarding enablement

Script prerequisites + first-run checklist

Owner: CSM / Enablement

02 Open investigations

Processes empty state + dpkg status semantics

Owner: Support / Product

03 Reusable support assets

Task-tracking guide + incident playbooks

Owner: CSM / Support

04 Expand test coverage

Second Ubuntu instance; grouping and batch tasks

Owner: Operations / Support

Direction: shorten TTFV, improve state clarity, and scale repeatable customer support.
